Such DNA molecules can be used in pharmaceutical and medical products (e.g. for wound debridement, clot dissolution) as well as in household items (e.g. detergents, dental hygiene products, meat tenderisers'). Other suitable substrates include those comprising or produced by picornaviruses, hepadnaviridae, (e.g. HBV, HCV), pammaherpesvirinae (e.g. EBV), lymphocryptoviruses, leukemia viruses (e.g. HFLV-1 and -11), produced by the control of t
                                                                                                                                                                      The present invention relates to a method for identifying sites on a target RNA which are accessible to pairing by antisense DNA, ribozymes of DNAzymes. The present sequence is a DNAzyme catalytic core sequence. In the method of the present invention the target sequence is incubated with DNAzymes, antisense oligonucleotides or ribozymes (such as the
                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying sites on a target or in vitro-synthesized RNA accessible antisense, ribozyme, or DNAzyme binding comprises incubating hybridizing the target RNA with an antisense oligodeoxynucleotides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  flaviviruses, togaviruses, herpesviruses (including alphaherpesviruse and betaherpesviruses), cytomegaolviruses (CMV), influenza viruses, viruses and retroviruses contributing to immunodeficiency diseases and syndromes (e.g. HiV-1 and -2), simian and feline immunodeficiency viruses and bovine leukemia viruses. They can also be used as regulators
                                                     present sequence). Any antisense oligonucleotide, ribozyme or DNAzym which is complementary to an accessible site in the target sequence hybridises to that site and the sequence is cleaved. The cleavage products can then be detected to identify the accessible binding sit
                                                                                                                                                                                                                                                                                                                                            Disclosure; Page 7; 38pp; English.

                                   ABA02749;
                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                             present sequence). Any antisense oligonucleotide, ribozyme or DNAzyme which is complementary to an accessible site in the target sequence hybridises to that site and the sequence is cleaved. The cleavage products can then be detected to identify the accessible binding sites
                                                                                                                                                                                                                                                                        DNAzymes. The present sequence is a DNAzyme catalytic core sequence In the method of the present invention the target sequence is incubwith DNAzymes, antisense oligonucleotides or ribozymes (such as the
                                                                                                                                                                                                                                                                                                                                                                   Identifying sites on a target or in vitro-synthesized RNA accessible to antisense, ribozyme, or DNAzyme binding comprises incubating hybridizing the target RNA with an antisense oligodeoxynucleotides, ribozymes or DNAzymes -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           07-FEB-2001

(I) is useful in diagnostic applications to identify the presence of genes and/or gene products indicative of a particular genotype and/or phenotype, e.g. a disease state or infection and for diagnosis of disease states or physiological abnormalities related to the expression of viral, bacterial or cellular RNA and DNA. (I) is useful in nucleic acid-based electronics, for the detection of specific target signalling molecules, in assays to assess the specificity, toxicity and effectiveness of various small molecules, nucleoside analogues or non-nucleic acid drugs or for detection of pathogens, biochemicals, organic or inorganic compounds. The present sequence is that of a DNAzyme motif of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABK09278
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC low-grade or folicular NEL. lymphocytic leukaemia, HIV (human) associated NHL, mantle-cell lymphoma (MCL), immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), communocytoma (IMC), small B-cell lymphocytic lymphoma, immune chrombocytopaemia, and inflammatory arthropathy. The NOGO-targetting cc uncleic acid is used to cleave RNA of the NOGO gene in the presence of a ccid interest of the NOGO experience of a ccid may be contacted with a cell to reduce NOGO activity of the cell and creat a patient having a condition associated with the level of NOGO. The creat a patient having a condition associated with the level of NOGO. The creat a patient having a condition associated with the level of NOGO. The creat a patient having a condition associated with the level of NOGO. The creat a patient having a condition associated with the level of NOGO. The creat a patient having a condition associated with the level of NOGO. The creat a patient having a condition associated with the level of NOGO. The contral nervous system (CNS) injury and cerebrovascular accident (CVA, cstroke), Alzheimer's disease, dementia, multiple sclerosis (MS), cstroke), Alzheimer's disease, dementia, multiple sclerosis (MS), cc stroke), Alzheimer's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob cc disease, muscular dystrophy, and/or other neurodegenerative disease cc states which respond to the modulation of NOGO expression. The cc present sequence is a DNAzyme molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma, B-cull, bulky
Human; chloride channel calcium activated 1; CICA1; ss; antiasthmatic; antiinflammatory; chronic obstructive pulmonary disease; COPD; asthma; chronic bronchitis; cystic fibrosis; obstructive bowel syndrome; oxygen therapy; bronchodilator; corticosteroid; vaccination; mucokinet acetylcysteine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecules, e.g., enzymatic nucleic acids and constructs, which down regulate expression of a CD20 gene growth inhibitor gene useful for treating, e.g., lymphoma,
                                                                                                                                                                                                                            Human CLCA1 gene enzymatic nucleic acid
                                                                                                                                                                                                                                                                                                         02-JUL-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or other nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or other nucleic acids (e.g. a ribozyme).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and central nervous system injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (MCSW/) MCSWIGGEN J.                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell, or tissue. The sequences are useful for reducing CLCA1 activity in a cell, chence, are useful for treatment of a patient having a condition CC associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the creatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to catamine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                         CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, CC by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies CC under conditions suitable for the treatment. Leukaemia or tumour CC angiogenesis is treated by administering (I) to the patient in CC conjunction with one or more of other therapies such as radiation or CC chemotherapy treatment. (I) is useful for reducing ERG activity in a CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of CC RRG gene, by contacting (I) with RNA, in the presence of a divalent CC cation such as Mg2+. (I) is useful for diagnosis of conditions and CC clisses related to the expression of ERG, and as diagnostic tool to CC examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically CC trageting genes that share homology with ERG gene or ERG fusion genes. ABK1734-ABK2719 represent nucleic acids, including antisense and CC enzymatic nucleic acid molecules which regulate expression of ERG, and CC related PCR primers of the invention.
                                                                                                                                                                                                                                                                                                     Query Match

G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; lung cancer; prostate cancer; colorectal cancer; brain cancer; cesophageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer; brain cancer; melanoma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; doxorubin; fluorouracil carboplatin; eathrea; diabetes; cyclophosphamide; doxorubin; fluorouracil carboplatin; dathrexate; gencitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection;
chemotherapy including pacilitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents a motif of an enzymatic nucleic acid used to modulate the function of a necrosis factor kappa B sub-unit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (1) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg'2'+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A specific inhibitors or the context of the context o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       15-AUG-1994;

                                                                                                                                                                                                                                                                                The present sequence is an example of a DNAzyme, an enzymatic conclear acid (ENA) that does not require the presence of a 2'-OH CC group for its activity. DNAzymes can be used as the ENA moiety in convel ENA peptide conjugates (I) of the invention that facilitate convel ENA peptide conjugates (I) of the invention that facilitate convel ENA peptide part of the conjugate is typically a fusogenic peptide such as a peptide given in ABP72395. The conjugates can be used to treat a cancer patient, where the cancer is breast, lung, colorectal, brain, oesophageal, stomach, bladder, pancreas, cervix, concertal and neck or ovary cancer, melanoma, lymphoma, glioma or control of the virus is HIV, hepatitis B virus, herpes simplex virus, cytomegalovirus, Rous sarcoma virus, herpes simplex virus, Ebola colorectal, influenza virus or papilloma virus (all colaimed). (I) are useful for introducing nucleotides, proteins cond/or non-nucleosidic small molecules into a cell and to detect the presence of a target molecules into a cell and to detect condiminations, cell or cell lysate. They are useful as diagnostic tools condiminations, cell or cell or diff and mutations within diseased cells or to detect the presence of a disease-related RNA in a cell.

                                                                                                                                                                                                                                                                                                          The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HERZ, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HERZ, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66525 - ABZ66529, ABZ66528 - ABZ66528 represent human ribozymes of the
Human HER2 synthetic DNAzyme

                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras s, N-Ras human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ66583 represent human ribozymes of timestric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for determining whether a combined is afflicted with a disorder characterised by the presence of the known nucleic acid. The method comprises: (i) amplifying, in an completed sample from the subject, the nucleic acid segment that, in an comprise sequence present in either the mutated or wild-type segments, that a complete sequence present in either the mutated or wild-type segments, the nucleic acid segment that, in an complete sequence present in either the mutated or wild-type segments, the nucleic acid segment that, in an complete sequence present in either the mutated or wild-type segments, the nucleic sequence of the nucleic acid segment that, in an complete sequence of the nucleic acid or wild-type segments, the nucleic segments of the nucleic segments of the nucleic segment segments. The nucleic segments of the nucleic acid segment segments, the nucleic segments of the present oligonucleotide compounds. AAZ34339 to AAZ34450 represent oligonucleotide compounds and the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC subject is afflicted with a disorder characterised by the presence of CC a known nucleic acid. The method comprises: (i) amplifying, in an CC isolated sample from the subject, the nucleic acid segment that, in an CC affected individual contains (A), (ii) treating the ampliforus with a CC catalytic nucleic acid (I) that specifically recognizes and cleaves a CC target sequence present in either the mutated or wild-type segments, CC but not in both; and (iii) detecting any cleavage caused by (I). Step CC (ii) may be performed concurrently with (i). The method is specifically used to diagnose cancer (especially), acquired immune deficiency CC syndrome and cystic fibrosis. (I) recognises as few as two by to create a cleavage site (contrast at least 4 by required by enzymes used in CC restriction fragment length polymorphism (RFLP) analysis); such sites CC cocur more frequently than restriction enzyme sites, and mismatched CC primers can be used to induce cleavage sites for (I). The method is CC cotic compounds. AAZ34339 to AAZ34450 represent oligonucleotide CC sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel method for the amplification and CC quantitative real-time determination of nucleic acid (I) using a primer CC attached to a 1-40 nucleotide sequence (II) in the transcription product. CC Amplification is done in the presence of an excess, preferably 50-500 nM, CC of a nucleic acid probe (III) and labeled by a reporter molecule and a CC quencher molecule. (I) encodes the motif 5'-GAAA-3' (A), and (II) CC contains the motif 5'-CUGANGA-3' (B). (III) has 25-60, especially 50, cm cleotides. The method is used to detect and quantify (I) from CC pathogenic bacteria. The method allows real-time detection and CC quantification of (I), particularly RNA by NASBA (RTM) (nucleic acid sequence-based amplification), without the difficulties associated with the of DNA probes (see Nucleic Acid Res., 26 (1998) 2150) and is suitable CC to routine use. Specifically the combination of (A) and (B) generates a CC hammerhead ribozyme that cleaves the probe and generates a fluorescent signal. Since many probes are cleaved, a high signal is produced, CC resulting in high sensitivity and shorter reaction times. The method is very specific since exact hybridization of probe to target is necessary CC cleavage to occur. Complicated probes are trequired because CC cleavage results in dissociation of the probe from the target (which CC allows multiplexing). Stable and inexpensive probes can be used, consisting mainly of 2'-deoxyribonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                  Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.

acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HBR2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HBR2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer and HIV infection, and AIDS. The sequences shown in ABSG6217 - ABZ66532 - ABZ65519, ABZ65529, ABZ65529, ABZ66529, ABZ66586 - ABZ66558 represent human ribozymes of the

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66555 - ABZ66529, ABZ66558 - ABZ66558 represent human ribozymes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 29-MAY-2002; 2002WO-US16840

                                             The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ65453, ABZ65532 - ABZ65519,

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ662217 - ABZ66533 - ABZ66539 - ABZ66529, ABZ66586 - ABZ66586 represent human ribozymes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66529, ABZ66529, ABZ66586 - ABZ66588 represent human ribozymes of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-R human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and acid molecule of the invention has cytostatic, anti-HIV, and acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ64543, ABZ65532 - ABZ66529, ABZ66529, ABZ66586 - ABZ66658 represent human ribozymes of ABZ66525 - ABZ66529, ABZ66586 - ABZ66658 represent human ribozymes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2003-140484/13

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K.Ras, H-Ras, N-F human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and acid molecule of the invention has cytostatic, anti-HIV, and acid molecules activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ66533 - ABZ665319, ABZ66525 - ABZ66529, ABZ66586 - ABZ66588 represent human ribozymes of acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. ```

acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-I human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and

The invention relates to a novel short

interfering

RNA (siRNA) nucleic e, that modulates

N-Ras,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, overrian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66525 - ABZ66529, ABZ66526 - ABZ66528 represent human ribozymes of
                                       The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein mRN which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' of the catalytic domain. Lack of expression of the hairless gene due

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the
                                           New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase to catagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

inherited mutations leads to the complete loss of hair, known as a trichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient concluding ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding a complete that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a coatalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen thair removal products which function by inhibiting hairless protein hair removal products which function by inhibiting hair cleaves the temps hairless protein the spread is the deoxy-ribozyme that cleaves the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1641.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC of the catalytic domain. Lack of expression of the hairless gene due to constraint the catalytic domain. Lack of expression of the hairless gene due to controlled mutations leads to the complete loss of hair, known as catalytician. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, concluding ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding cability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a ccatalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids cre useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen chair removal products which function by inhibiting hairless protein compositions for the catagen composition by inhibiting hairless protein mRNA immediately after nucleotide 1698.

                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA
CC which comprises a catalytic domain that cleaves mRNA at a defined
CC consensus sequence and binding domains contiguous with the 5' and 3' ends
CC of the catalytic domain. Lack of expression of the hairless gene due to
CC inherited mutations leads to the complete loss of hair, known as
CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting
CC gene suppression is through the use of catalytic nucleic acid technology,
CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have
CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have
CC asalf-catalytic enzymatic function and sequence specific RNA binding
CC ability. Small DNA oligonucleotides that have a similar structure to the
CC hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a
CC catalytic core and two sequence specific arms. The deoxy-ribozymes have
CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids
CC are useful in pharmaceutical compositions for inhibiting hair production
CC by a hair-producing cell, for inhibiting hair growth and for inhibiting
CC bhase. A non-human transgenic mammal is useful as a model for testing
CC human hairless protein mRNA immediately after nucleotide that Cleaves the
CC catalytic core and two immediately after nucleotide that Cleaves the
CC phase. A non-human transgenic mammal is useful as a model for testing
CC human hairless protein mRNA immediately after nucleotide.

                                                                                                                                                                                                                                                                                                        a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAsymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1750.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have

```
CC which comprises a catalytic domain that cleaves mRNA at a defined CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the Chammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have more lesient consensus cleavage site requirements and are less likely to CC degrade, in vivo, that hammerhead ribozymes. The catalytic mucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the catagen compassion. The sequence which function by inhibiting hairless protein mCC hair removal products which function by inhibiting hairless protein mCC haman hairless protein mRNA immediately after nucleotide 1801.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producin cell, or for inhibiting transition of a hair follicle from anagen phase

specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic made the constant of the catalytic enzymatic functions and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a
                                                     catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The

consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a smillar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Catalytic DNA; catalytic RNA; hairless protein; ss; hair loss; atrichia; hair growth; hirsutism; catalytic nucleic ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-r catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal produc
                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein which comprises a catalytic domain that cleaves mRNA at a define
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein mRNA, useful for inhibiting cell, or for inhibiting transition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 3; Page 35; 65pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2003-093020/08.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catager phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves human hairless protein mRNA immediately after nucleotide 2028.
The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at defined consensus sequence and binding domains contiguous with the 5 and 3 end of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsuitism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Catalytic DNA; catalytic RNA; hairless protein; 88; hair loss; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Deoxy-ribozyme, cleaving hairless protein mRNA after nucleotide 2033.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             25-FEB-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hair loss; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozy catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human hairless protein mRNA immediately after nucleotide 2033.
                                                                                                                                        New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               depilatory.

Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the CC hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids CC are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen CC thair removal products which function by inhibiting hairless protein CC human hairless protein mRNA immediately after nucleotide 2047.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                              to catagen phase
```

Page 35; 65pp; English.

CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids care useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting that removal products which function by inhibiting hairless protein CC hair removal products which function by inhibiting hairless protein CC hair removal products which function by inhibiting hairless protein CC human hairless protein mRNA immediately after nucleotide 2083. The invention discloses a new catalytic DNA or RNA molecule that specifically cleaves, or inhibits expression of, Hairless Protein which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves mRNA at a defined which comprises a catalytic domain that cleaves make the comprise at the BP; 9 A; 7 C; 9 G; 4 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNMazymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the complete aribozyme, called deoxy-ribozymes having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have completely in pharmaceutical compositions for inhibiting hair growth and for inhibiting base. A non-human transgenic mammal is useful as a model for testing CC hair removal products which function by inhibiting hairless protein CC compression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 2380.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC inherited mutations leads to the complete loss of hair less gene due to cf the catalytic domain. Lack of expression of the hairless gene due to cf the genes promoting hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, translent CC gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonuclectides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have are useful in pharmaceutical compositions for inhibiting hair production by a hair-producting cell, for inhibiting hair growth and for inhibiting the catalytic micleic acids are useful and paradection of a hair follicle from the anagen phase to the catagen CC phase. A non-human transgenic mammal is useful as a model for testing thair removal products which function by inhibiting hairless protein mCC than hairless protein mRNA immediately after nucleotide 2395.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase {\sf cell}, or for inhibiting transition of a hair follicle from anagen phase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC (BSCDNA) in eukaryotic cells. They use a DNA cassette that produces CC sscDNA in vivo. The cassette contains the Moloney murine leukemia virus creverse transcriptase/RNase H, a bacterial restriction endonuclease CC reverse transcriptase synthesises cDNA of a specified sequence. CC which the reverse transcriptase synthesises cDNA of a specified sequence. CC The ssDNA is then modified to remove all flanking vector sequences by CC taking advantage of the stem-loop structure of the cDNA, which forms as CC a result of the inclusion of a inverted tandem repeat that allows the ScDNA to fold back on itself, forming a double stranded DNA stem, in CC the sequence of interest. The double-stranded stem contains one or more for delivery to a cell. The vectors are is useful for producing a ssDNA concleic acid molecule which is an antisense sequence or aptamer, an mRNA contains and target cell are useful for antisense sequence or aptamer, an mRNA contains and the course of the cell are useful for alleviating pathological conditions by regulating gene expression. The present oligonucleotide was used to condition a vector for use in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                      ribozymes, tumour necrosis factor (TNF)alpha ribozyme, rat and human vascular epithelial growth factor (VEGF) ribozymes. These ribozymes can be used for treating or preventing a disease or condition responsive to an alteration in the expression of a gene, where the ribozyme is capable of cleaving the RNA transcribed from the gene. They can be used for treating or preventing a disease or condition associated with the proliferation of rapidly dividing cells, e.g. cancer such as malignant glioma. They can also be used for inhibiting the proliferation of cells. The use of 2'-amino modified pyrimidine can provide ribozymes of improved stability which retain the activity of the unmodified ribozyme. The
                                                                                                                                                                                                                                                                                                                                                                   The invention provides novel modified ribozymes that have 3 or more pyrimidine nucleotides (PMN) in the ribozyme modified at the 2' position, where the PMNs are modified to 2' amino PMNs and the ribozymes exhibit improved stability to RNAase degradation and exhibits 85% or more catalytic activity of the unmodified ribozymes. The ribozymes of the invention are selected from rat and human protein kinase C (PKC) alpha
